

Dear Family,

Throughout the next few weeks, our math class will be studying two-dimensional and three-dimensional figures. The students will use definitions to identify and describe characteristics of these figures. We will also learn how to find volume of rectangular prisms.

You can expect to see homework that includes identifying types of triangles and quadrilaterals.

Here is a sample of how your child will be taught to classify a triangle by the length of its sides.

Vocabulary

congruent Having the same size and shape

trapezoid A quadrilateral with exactly one pair of parallel sides

polyhedron A three-dimensional figure with faces that are polygons

lateral faces Faces of a polyhedron that connect the bases

MODEL Classify a triangle by the length of its sides.

A triangle has side lengths 3 in., 2 in., and 3 in. What type of triangle is it?

STEP 1

Identify how many sides are congruent.

There are 2 sides with lengths of

3 in.

STEP 2

Determine the correct classification.

A triangle with two congruent sides is

isosceles

Tips

Congruent Figures

Congruent figures are figures that have the same size and shape.

If measurements aren't given and you need to check whether a figure has pairs of congruent sides or angles, trace the figure and cut out the tracing. Then fold the figure to see if the sides or angles match.

Activity

Try to have students commit most of the classifications of triangles, quadrilaterals, and polyhedrons to memory. You can make a series of flash cards with the classifications on one side of the card and definitions and/or sketches of examples on the other side of the card.

Carta para la casa

Querida familia

Durante las próximas semanas, en la clase de matemáticas estudiaremos las figuras bidimensionales y tridimensionales. Usaremos las definiciones para identificar y describir las características de esas figuras. También aprenderemos a hallar el volumen de los prismas rectangulares.

Llevaré a la casa tareas con actividades para identificar diferentes tipos de triángulos y cuadriláteros.

Este es un ejemplo de la manera como aprenderemos a clasificar un triángulo por sus lados.

Vocabulario

congruentes Figuras que tienen el mismo tamaño y la misma forma

trapezio Un cuadrilátero que tiene exactamente 1 par de lados paralelos

poliedro Una figura tridimensional con caras que son polígonos

caras laterales Las caras poligonales de un poliedro que conectan las bases

MODELO Clasificar un triángulo por sus lados.

Los lados de un triángulo miden 3 pulg., 2 pulg. y 3 pulg. ¿Qué tipo de triángulo es?

PASO 1

Identifica cuántos lados son iguales.

Hay dos lados que tienen la misma longitud de 3 pulg.

PASO 2

Determina la clasificación correcta.

Un triángulo con dos lados congruentes es

isósceles

Figuras congruentes

Las figuras congruentes son figuras que tienen el mismo tamaño y la misma forma. Para comprobar si una figura tiene pares de lados o ángulos congruentes, dibuja la figura y recórtala. Luego dobla la figura para ver si los lados o los ángulos coinciden.

Para estar seguro de que dos figuras son congruentes, haz una lista de todos los lados y ángulos que corresponden uno con el otro y luego verifica que las medidas de cada par sean iguales.

Actividad

Anime a su hijo/a a memorizar las clasificaciones de los triángulos, los cuadriláteros y los poliedros. Puede hacer tarjetas nemotécnicas con las clasificaciones en un lado y las definiciones y/o ejemplos visuales en el otro lado de cada tarjeta.
